## *Warehouse Inventory Automation*

### Team Members:

- Amir Hamza (Team Leader)
- Jack Creighton (Backend Developer)
- Jacob Ramsey-Smith (Simulation Developer)
- Stamatios Morellas (Frontend Developer)

### Advisor:

- Dr. Diane Rover

[hr24612@iastate.edu](mailto:hr24612@iastate.edu)

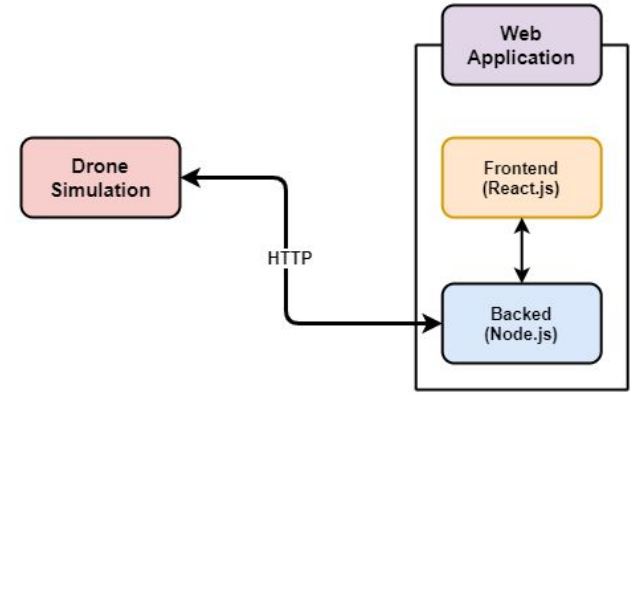

# **Problem Statement**

# Original Project Plan

# Revised Project Plan

# Non-Functional Requirements

- The drone should have intuitive controls
- Project components communicate quickly and reliably
- The safety of people working in the warehouse must be considered
- A user-friendly, consistent interface for the web application

# Functional Requirements

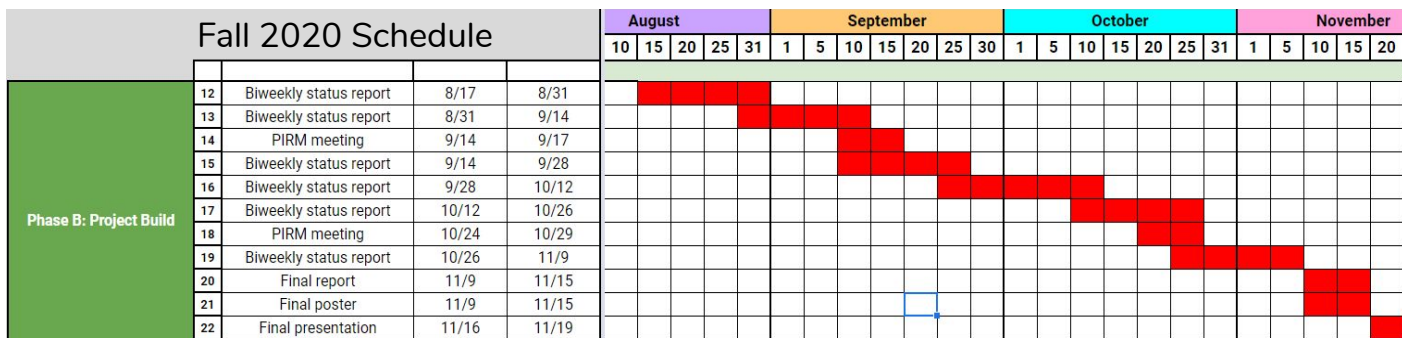

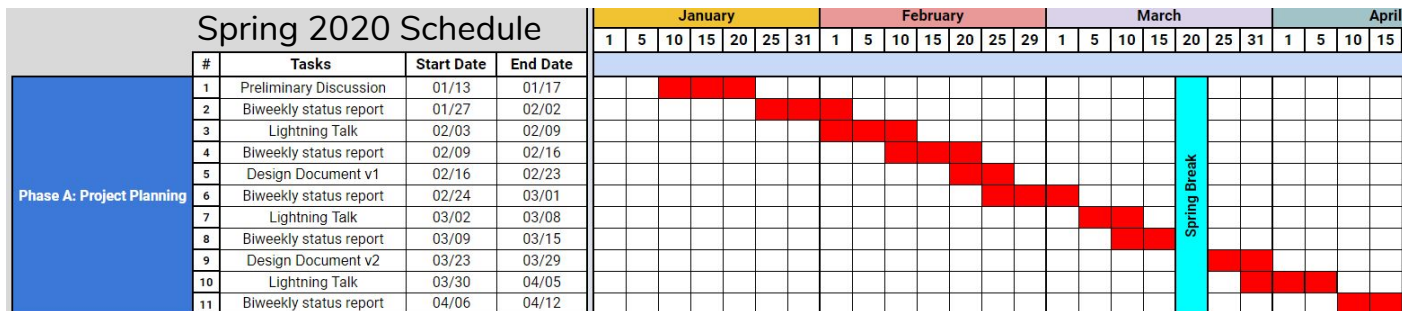

- The drone must be able to scan inventory at all heights of the warehouse
- The drone must be capable of scanning QR codes off of the inventory
- The gathered data from the drone must be transmitted to the server
- Data in the database must be visible to users

# Operational Environment

- Our project simulates a warehouse environment using an application called Webots

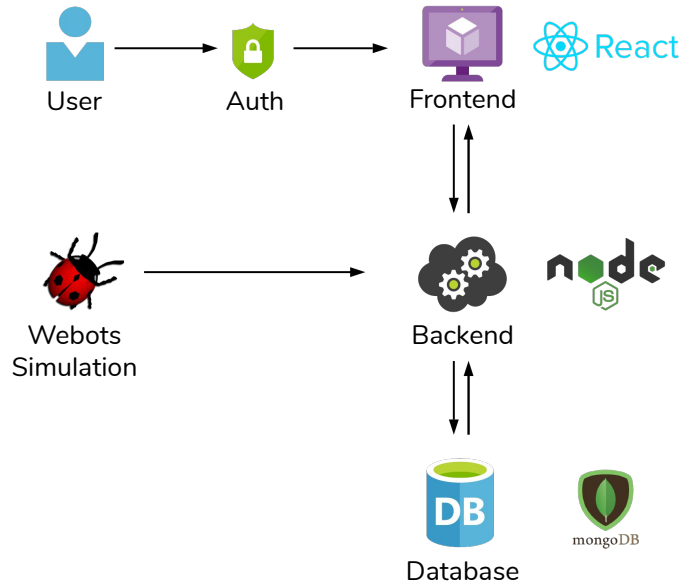

# Project Design

# Project Design Overview

- Our project utilizes a full stack to allow for users to sign on to a web application and view data obtained from webots.
- Main components of system:
  - Webots
  - Client Application
  - Server Application
  - Database

# Development Practices

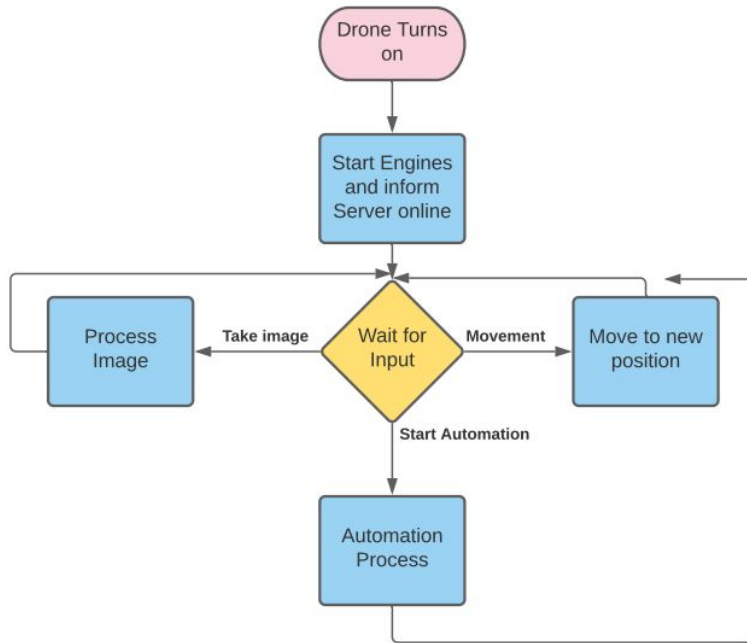

- Agile
- Peer-review
- Model-View-Controller (MVC) architecture
- Side-by-side development (Pair Programming)
- Engineering Standards:
  - IEEE P1936.1: Standard for Drone Applications Framework
  - ISO 18004: Automatic identification and data capture techniques

# **Webots Simulation Implementation & Demo**

# Webots Design Overview

- The team set up a sample warehouse with inventory and QR codes
- A drone was used to fly around and scan the QR codes
- An autonomous program was created for the drone to assist in the efficiency in the scanning of inventory

# Webots

- Scanning a QR code
  - The drone is equipped with a camera, and takes pictures of the QR codes on inventory
  - That picture is then scanned using Google's Zebra Crossing library
  - After the image is successfully processed, the data obtained from it is put into a JSON object and sent to the backend server in an HTTP request
- Automation process
  - The drone starts by scanning the QR code in front of it.
  - The drone then moves 5 boxes over, stopping at each one to ensure a successful scan of them
  - The drone then accounts for the gap in the shelves and repeats
  - The automation process can be cancelled and reset if needed.

# Webots Challenges

- Transitioning to a real environment
  - The maximum distance a successful scan was obtained: 1.7 meters
  - The maximum distance successful scans were consistently obtained: 1.4 meters
  - Drone was capable of successfully capturing image in non-ideal lighting

# **Webots Demonstration**

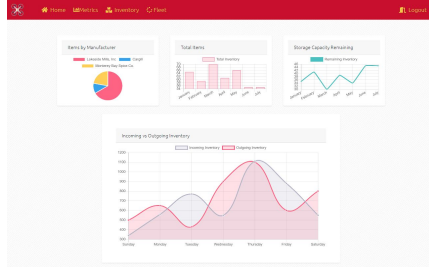

# **Web Application Implementation & Demo**

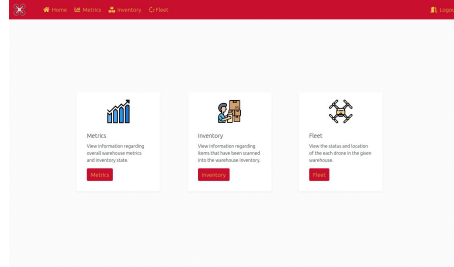

# Website Design Overview

Metrics Page

Home Page

Inventory Page

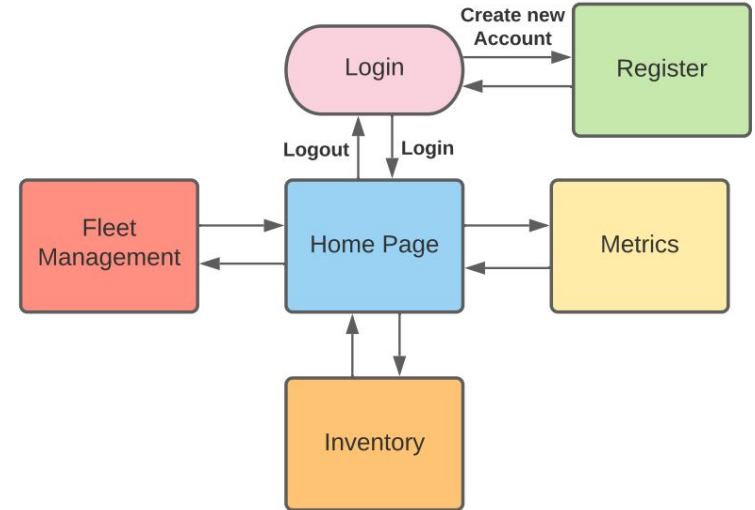

The Inventory Page features a red header with navigation links: Home, Metrics, Inventory, and Fleet. The main content area displays a table titled 'Inventory' with the following columns: ID, Title, Manufacturer, Quantity, Section, Shelf, Row, Arrival, and Departure. The table contains 10 rows of data.

ID	Title	Manufacturer	Quantity	Section	Shelf	Row	Arrival	Departure
4545-00000001	Flour	Labadee Mills, Inc.	4	1	1	1	1/1/2020	12/1/2020
4545-00000002	Wheat	Labadee Mills, Inc.	12	1	1	1	1/1/2020	12/1/2020
4545-00000003	Sugar	Labadee Mills, Inc.	4	1	1	1	1/1/2020	12/1/2020
4545-00000004	Flour	Labadee Mills, Inc.	4	1	1	1	1/1/2020	12/1/2020
4545-00000005	Wheat	Labadee Mills, Inc.	4	1	1	1	1/1/2020	12/1/2020
4545-00000006	Sugar	Labadee Mills, Inc.	4	1	1	1	1/1/2020	12/1/2020
4545-00000007	Flour	Labadee Mills, Inc.	4	1	1	1	1/1/2020	12/1/2020
4545-00000008	Wheat	Labadee Mills, Inc.	4	1	1	1	1/1/2020	12/1/2020
4545-00000009	Sugar	Labadee Mills, Inc.	4	1	1	1	1/1/2020	12/1/2020
4545-00000010	Flour	Labadee Mills, Inc.	4	1	1	1	1/1/2020	12/1/2020

Fleet Page

The Fleet Page features a red header with navigation links: Home, Metrics, Inventory, and Fleet. The main content area displays a table titled 'Drone Fleet' with the following columns: ID, Battery, Location, and Status. The table contains 10 rows of data.

ID	Battery	Location	Status
4545	100%	warehouse 18A	OK
22345	100%	warehouse 18B	OK
66276	100%	warehouse 18C	OK
90901	100%	warehouse 11B	OK
34500	100%	warehouse 11B	OK
80000	100%	warehouse 11B	OK
34501	100%	warehouse 11B	OK
70234	100%	warehouse 11B	OK

# Technologies Used

Webots:

- Java

Web Application:

- MongoDB
- Express
- ReactJS
  - Core UI
- Node.js

Java™

express

# Web Application

- Client Application
  - Adobe Xd - Mockups/Wireframing
  - Bootstrap - CSS library
  - CoreUI for React - UI Components Library
- Server Application
  - Express - Web framework for Node.js
  - Mongoose - MongoDB object modeling for Node.js
- Database
  - MongoDB - Document-based cloud database

# Web Application Demonstration

# Testing

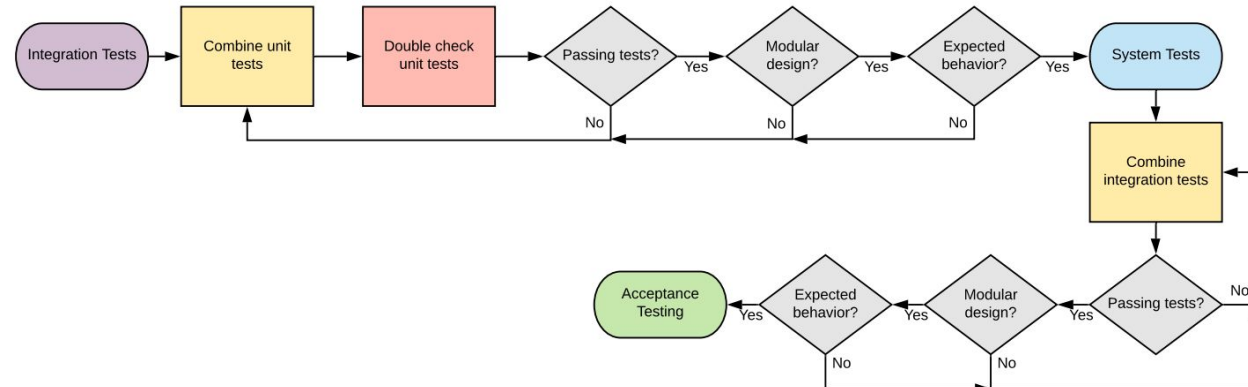

# Unit Testing

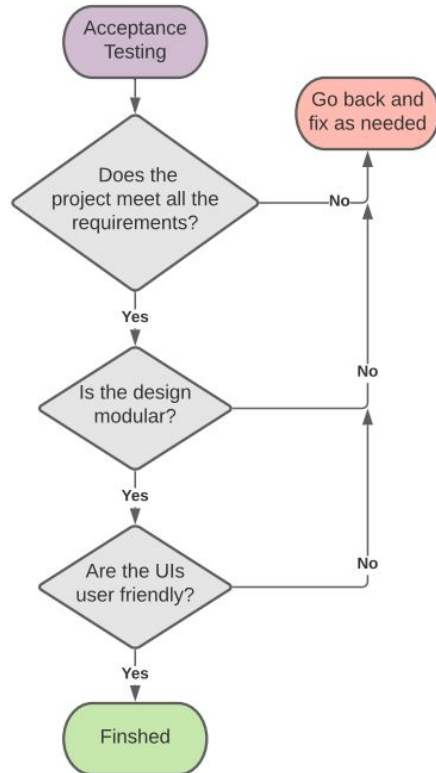

- Unit tests were performed throughout the project to ensure functionality of each component before proceeding to use the component in the full system
  - Querying and saving data to the database
  - Testing the Zebra Crossing library with sample pictures
  - Testing the camera's ability to capture and save images.

# Integration and System Testing

- Integration testing was performed to check if the unit tests functioned together.
  - Testing that the QR code scanning works in the Webots environment
- System testing was performed to ensure that different modules in our project work together.
  - Putting data from Webots into the database and using that in the front end

# Acceptance Testing

- Acceptance testing was performed to ensure that our project meets are requirements and is a modular design
  - Changing front end to be more intuitive to first time users
  - Cleaning code to be more readable and more modular in design

# Conclusion

# Conclusion

- Main Goal → Increase warehouse efficiency through automated inventory management
- Original Plan → Fully autonomous, physical drone
  - Not feasible due to time and remote work constraints
- New Plan → Transition select components to a digital environment
  - Full autonomy → Partial autonomy
  - Viable alternative
- Challenges
  - COVID-19
  - Learning new technologies
  - Time management
